BUSINESS ANALYSIS PORTFOLIO PROJECT

VRINDA STORE

Annual Sales Analysis Dashboard

2022 | E-commerce sales performance

PROJECT REPORT

Business intelligence · Sales analysis · Customer insights

Prepared by	Vrinda-Store-Sales-Analysis
Primary tool	Microsoft Excel
Dataset currency	Indian Rupee (INR)

01 | Executive Summary

This project examines Vrinda Store's 2022 e-commerce transaction data to understand sales performance, customer mix, sales-channel contribution, geographical performance, and order fulfilment. The findings are calculated from the underlying Vrinda Store data sheet in the supplied workbook.

INR 21,176,377	31,047	28,471	92.25%
Total recorded sales	Transaction records	Distinct Order IDs	Delivered record share

Headline findings

1. Women contributed 64.05% of recorded sales, compared with 35.95% for men.
2. March was the strongest sales month at INR 1,928,066; November was the lowest at INR 1,615,356.
3. Amazon represented 35.48% of transaction records, followed by Myntra (23.36%) and Flipkart (21.59%).
4. 28,641 of 31,047 records were marked Delivered, equal to 92.25% of records.

Business relevance

The analysis provides a structured view of where sales are concentrated and where further investigation may be valuable. It can help stakeholders prioritize product/category review, understand month-to-month movement, assess channel mix, and investigate non-delivered order outcomes.

Interpretation note: the source contains 31,047 rows and 28,471 distinct Order IDs. Record counts should not be described as unique orders.

02 | Business Problem & Objectives

Business context

E-commerce teams need to understand sales outcomes across customer groups, time periods, product categories, sales channels, and fulfilment statuses. Without a consolidated view, it can be difficult to identify where revenue is concentrated, where performance changes, and which operational outcomes deserve closer attention.

Business problem statement

How can Vrinda Store use its 2022 transaction data to monitor sales performance, understand customer and channel patterns, and identify opportunities for commercial and operational improvement?

Analysis questions

- Which customer gender and age segments account for the largest sales contribution?
- How does recorded sales amount vary by month?
- Which e-commerce channels account for the largest share of transaction records and sales?
- Which states contribute the highest sales amounts?
- What is the distribution of Delivered, Returned, Cancelled, and Refunded records?
- Which product categories account for the greatest sales amounts?

Project objectives

- Summarize sales amount and transaction-record volume using clear KPIs.
- Compare customer segments, product categories, channels, and states.
- Review monthly sales movement and order-status distribution.
- Translate descriptive findings into practical recommendations for further business investigation.

Scope

The report covers the 2022 dataset supplied in the workbook. It is descriptive analysis; it does not establish causation, profitability, customer lifetime value, or the reasons behind returns and cancellations.

03 | Dataset & Data Preparation

Dataset profile

Attribute	Workbook evidence
Reporting period	2022
Source worksheet	Vrinda Store
Transaction records	31,047 rows
Distinct Order IDs	28,471 distinct IDs
Fields	21 columns
Currency	INR (Indian Rupee)
Recorded sales amount	INR 21,176,377

Key fields used

- **Customer:** Gender, Age, Age Category, Customer ID.
- **Order:** Order ID, Date, Month, Status.
- **Commercial:** Channel, SKU, Category, Quantity, Amount, Currency.
- **Geography:** Shipping city, state, postal code, and country.

Data checks and interpretation

The source data contains 0 blank cells across 21 fields. There are 2,576 rows beyond the distinct Order ID count. These repeated IDs may represent multiple items or records associated with an order; they should not automatically be treated as duplicate errors. Record-based measures and distinct-order measures are therefore kept separate.

The workbook records INR for all rows. Before publication, customer IDs, order IDs, and postal codes should be removed or anonymized in any public sample dataset.

04 | Methodology & Tools

Analysis workflow

1 Source data	2 Prepare	3 Analyze	4 Communicate
Transaction-level Excel data	Review fields, dates, categories and identifiers	Summarize by month, gender, status, channel, state and category	Present KPIs, charts, findings and recommendations

Tools and analytical techniques

Tool / technique	How it supports the analysis
Microsoft Excel	Primary environment for organizing data, analysis, and dashboard presentation.
Pivot Tables	Summarize records and sales amount across business dimensions.
Pivot Charts / charts	Communicate comparisons and patterns visually.
Formulas and KPI calculations	Calculate totals, shares, and ratios such as delivered-record share.
Filters / slicers (where configured)	Allow users to explore selected subsets of the dashboard data.

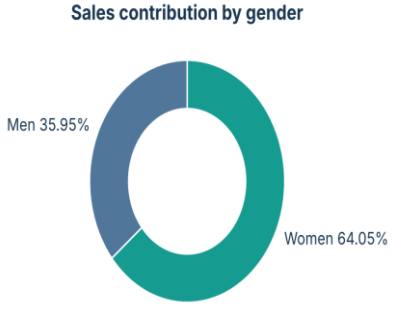

Measures used

- Total recorded sales: sum of Amount = INR 21,176,377.
- Transaction records: number of rows = 31,047.
- Distinct orders: distinct Order ID count = 28,471.
- Delivered-record share: Delivered rows divided by all rows = 92.25%.
- Channel share: records in a channel divided by all records.

Method note: the report uses descriptive aggregation. No forecasting, causal testing, margin analysis, or profitability analysis is claimed.

05 | Sales & Customer Analysis

Overall sales and gender mix

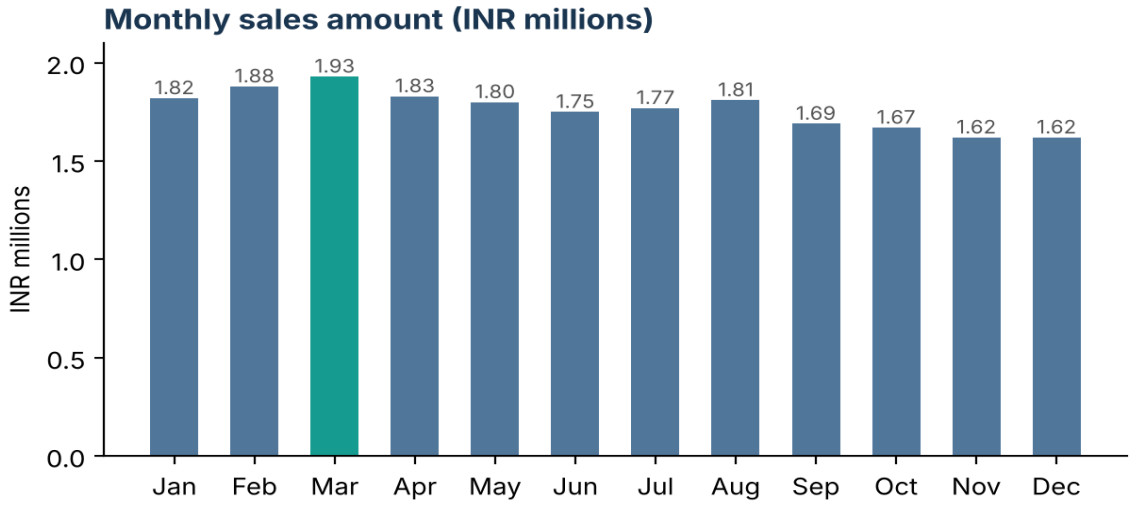

Total sales amount

INR 21,176,377

Women: **INR 13,562,773** (64.05%)
Men: **INR 7,613,604** (35.95%)

Monthly sales trend

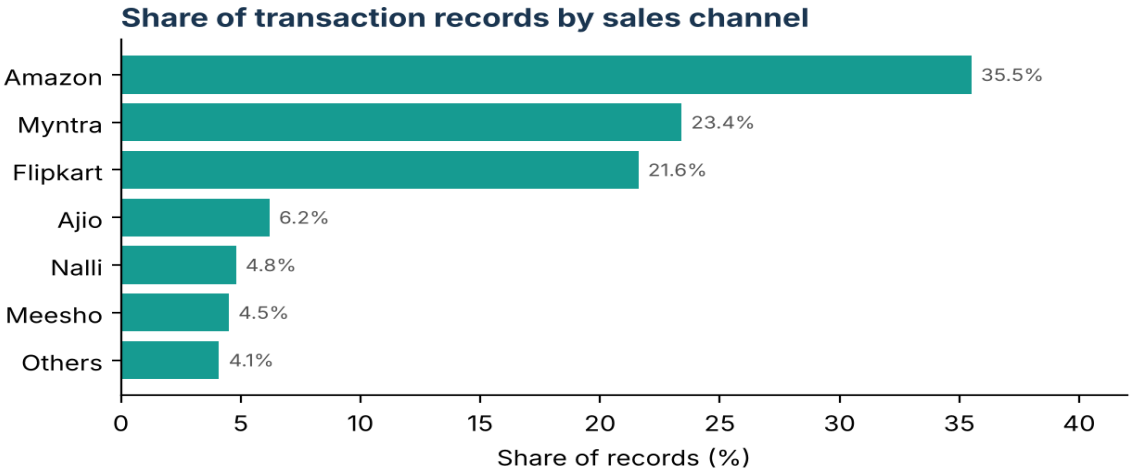

March recorded the highest monthly sales (INR 1,928,066); November recorded the lowest (INR 1,615,356). The difference is INR 312,710. This identifies periods for deeper review, but the dataset alone does not explain the causes of monthly variation.

Customer age segments

Age category	Records	Share of records
Adult	15,543	50.06%
Teenager	9,415	30.32%
Senior	6,089	19.61%

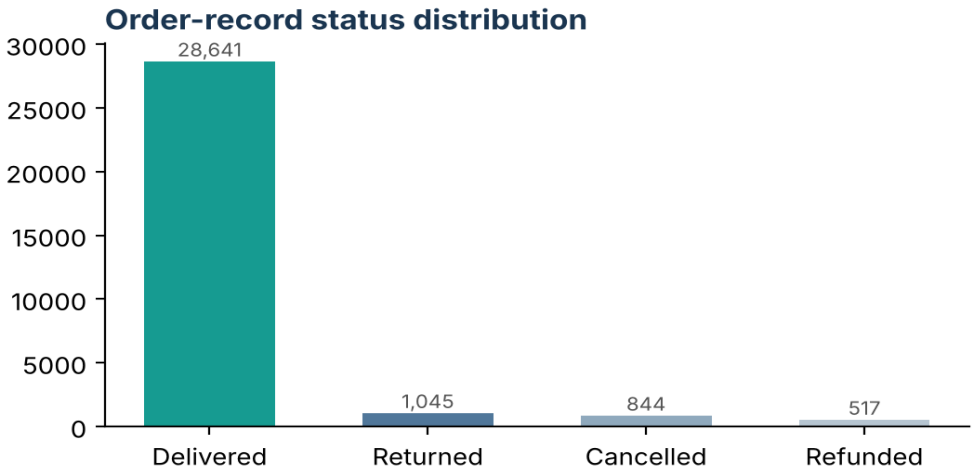

06 | Channel, Fulfilment & Recommendations

Sales-channel mix

Amazon, Myntra, and Flipkart together account for 80.44% of transaction records. This indicates a concentrated channel mix by record volume. Channel profitability and customer acquisition cost are not available, so volume should not be treated as a proxy for profit.

Order fulfilment

Delivered records account for 92.25% of all rows. Returned, Cancelled, and Refunded records total 2,406 rows. Further analysis of reasons, product types, channels, and locations would be needed to identify drivers.

Leading states by sales amount

State	Sales amount
Maharashtra	INR 2,990,221
Karnataka	INR 2,646,358
Uttar Pradesh	INR 2,104,659
Telangana	INR 1,712,439
Tamil Nadu	INR 1,678,877

Management recommendations

1. Review women's product and category performance to understand the drivers of the largest sales segment.
2. Compare campaigns, inventory, and product mix around high- and low-sales months to investigate seasonality.
3. Assess channel performance using margin, returns, and acquisition costs—not order volume alone.
4. Segment returned, cancelled, and refunded records by product, channel, and geography to identify improvement opportunities.
5. Study leading states to identify replicable customer and product patterns.

07 | Conclusion & Project Resources

Conclusion

The 2022 Vrinda Store dataset records INR 21,176,377 in sales amount across 31,047 transaction rows and 28,471 distinct Order IDs. The analysis shows that women's products contribute the larger share of sales, monthly sales vary across the year, a small number of channels account for most transaction records, and most records are marked Delivered. Geographical and category summaries provide additional directions for focused commercial analysis.

Business value

The dashboard and report demonstrate how transactional data can be organized into business-facing measures and interpreted to identify where further investigation may create value. Recommendations are evidence-led next steps, rather than claims that the dataset proves a particular cause.

Skills demonstrated

- Business problem framing
- Exploratory data analysis
- KPI calculation and interpretation
- Customer and channel segmentation
- Trend and geographical analysis
- Data visualization
- Business recommendations
- Microsoft Excel
